

## Poster Description

Danielle Carpenter-Chatman

My research poster is on the use of non-invasive tech, such as imaging systems like CT scans and X-rays, to examine ancient skeletal remains for trauma and disease. I am using a comparative study where I examine case files of research and compare them to see how their use of non-invasive tech is beneficial to the study of ancient skeletal remains or how it could be expanded on in future studies. The case studies will be sourced from peer reviewed books and journals found via the CSU Stanislaus library and Google Scholar. I have used case studies from China, Greece and Italy with bone age ranges from 120,000 years old to modern times, circa 50 years ago.
