

Contradictions in Bilingual Studies

Guadalupe Godinez

This project focuses on a more cognitive aspect of being bilingual, as compared to an economic or political aspect, and on the different articles that have been published on related material. The studies that have been conducted in the field of bilingualism and cognition vary from study to study. Many focus on inhibitory control because the continuous dual-language activation in the brain suggests that bilinguals exercise cognitive control, but it doesn't change the fact that the results of the studies differ and often contradict each other. This project will analyze the experiment types, tasks, and tests that lead to a certain conclusion for a study and compare them to the other studies that were conducted to determine the better conditions in which the study can run effectively.
