

Development, Diagnosis, Treatment, and Prevention of Hypophysitis

My research is on hypophysitis which is an autoimmune disease within the pituitary gland. There is primary hypophysitis and secondary hypophysitis. There are several forms of primary hypophysitis which affect different areas of the pituitary gland or the whole structure. Secondary hypophysitis is caused by other conditions within the body or medications.

I will also cover the studies that have been performed on a small study. However, the studies are insufficient and there is a lot more research that needs to be performed to fully understand the manifestation of hypophysitis, knowing the difference between the types of hypophysitis and correctly diagnosing it as well as finding effective treatment options that will prevent relapses.
